

Course Introduction

Electromagnetics - Electrical Engineering

1. Scope and objectives

This session sets out what the module covers, how the topics connect, and what students are expected to be able to do by the end. It is the map for the weeks that follow.

2. Assessment

Assessment combines continuous work through the semester with a final examination. Continuous work is designed to give feedback early enough to act on, so submissions are graded and returned promptly.

3. How to study this module

The material builds cumulatively: each week assumes the previous one. Working the exercises as they are set, rather than in a block before the examination, is the single strongest predictor of success in this module.
